Website review for CyprusNet

The Cyprus Bakeries website · cyprusbakeries.com

By Aleya Kewseedin · 10 November 2026

I looked at the Cyprus Bakeries website the way a visitor would. Thank you for making it easy to find bakeries by town. Below is what already works, and the two things I would fix first.

What is working well

1. **It is safe and tidy.** The padlock in the browser is valid, so visitors' connections are protected, and page addresses are short and easy to read.
2. **Each bakery page answers the main question.** Address, phone, a full week of opening hours, a live "now open" label and a map are all in one place.

The two things to fix first, in order

1 Some buttons cannot be understood or reached without a mouse

What visitors experience	The small arrows and dots on the home page slideshow, the magnifying-glass search icon and the menu icon have no names. Software that reads pages aloud for blind visitors just says "button". People who use the keyboard instead of a mouse cannot reach the menu at all, so they cannot get to Login or Register.
Why it matters	People with sight loss or limited hand movement are shut out of parts of the site, and you lose their visits.
Ask your web developer to	Give every icon a short text name (for example "Search", "Next slide"), make the menu reachable with the Tab key, and show a clear highlight on whatever button is selected.
How you can check it is fixed	On the home page, put your mouse aside and press the Tab key several times. You should see a highlight move to every button, and you should be able to open the menu with the Enter key.

2 A blank white screen while the page loads on a weak connection

What visitors experience	On a slow connection I saw a completely white page for about 8 seconds, with no message. Pictures and icons appeared later.
Why it matters	Someone looking up a bakery while out and about may think the site is broken and leave.
Ask your web developer to	Show the page header and a simple "loading" message straight away, and make the pictures smaller so they load sooner.
How you can check it is fixed	Open the site on your phone with a weak mobile signal. Something should appear within a second or two, instead of an empty white screen.
